The greatest invention of the nineteenth century was the invention of the method of invention.
— Alfred North Whitehead

Call me Ishmael.
— Herman Melville

When you call me that, smile!
— Owen Wister
Answer me in one word.
— William Shakespeare

O! call back yesterday, bid time return.
— William Shakespeare

There is a point at which methods devour themselves.
— Frantz Fanon
OBJECTIVES

In this chapter you will learn:

- How static methods and fields are associated with an entire class rather than specific instances of the class.
- To use common Math methods available in the Java API.
- To understand the mechanisms for passing information between methods.
- How the method call/return mechanism is supported by the method call stack and activation records.
- How packages group related classes.
- How to use random-number generation to implement game-playing applications.
- How the visibility of declarations is limited to specific regions of programs.
- What method overloading is and how to create overloaded methods.

6.1 Introduction

• Divide and conquer technique
  – Construct a large program from smaller pieces (or modules)
  – Can be accomplished using methods

• static methods can be called without the need for an object of the class

• Random number generation

• Constants
6.2 Program Modules in Java

- Java Application Programming Interface (API)
  - Also known as the Java Class Library
  - Contains predefined methods and classes
    - Related classes are organized into packages
    - Includes methods for mathematics, string/character manipulations, input/output, databases, networking, file processing, error checking and more
Good Programming Practice 6.1

Familiarize yourself with the rich collection of classes and methods provided by the Java API (java.sun.com/javase/6/docs/api/). In Section 6.8, we present an overview of several common packages. In Appendix G, we explain how to navigate the Java API documentation.
Software Engineering Observation 6.1

Don’t try to reinvent the wheel. When possible, reuse Java API classes and methods. This reduces program development time and avoids introducing programming errors.
6.2 Program Modules in Java (Cont.)

• Methods
  – Called functions or procedures in some other languages
  – Modularize programs by separating its tasks into self-contained units
  – Enable a divide-and-conquer approach
  – Are reusable in later programs
  – Prevent repeating code
Software Engineering Observation 6.2

To promote software reusability, every method should be limited to performing a single, well-defined task, and the name of the method should express that task effectively. Such methods make programs easier to write, debug, maintain and modify.
Error-Prevention Tip 6.1

A small method that performs one task is easier to test and debug than a larger method that performs many tasks.
Software Engineering Observation 6.3

If you cannot choose a concise name that expresses a method’s task, your method might be attempting to perform too many diverse tasks. It is usually best to break such a method into several smaller method declarations.
6.3 **static Methods, static Fields and Class Math**

- **static method (or class method)**
  - Applies to the class as a whole instead of a specific object of the class
  - Call a *static* method by using the method call: 
    `ClassName . methodName ( arguments )`
  - All methods of the `Math` class are *static*
    - example: `Math.sqrt(900.0)`
Fig. 6.1 | Hierarchical boss-method/worker-method relationship.
Class Math is part of the java.lang package, which is implicitly imported by the compiler, so it is not necessary to import class Math to use its methods.
6.3 static Methods, static Fields and Class Math (Cont.)

• Constants
  – Keyword final
  – Cannot be changed after initialization

• static fields (or class variables)
  – Are fields where one copy of the variable is shared among all objects of the class

• Math.PI and Math.E are final static fields of the Math class
<table>

</tbody>
</table>

Fig. 6.2 | Math class methods.
6.3 static Methods, static Fields and Class Math (Cont.)

• Method **main**
  
  – **main** is declared **static** so it can be invoked without creating an object of the class containing **main**

  – Any class can contain a **main** method
    
    • The JVM invokes the **main** method belonging to the class specified by the first command-line argument to the **java** command
6.4 Declaring Methods with Multiple Parameters

• Multiple parameters can be declared by specifying a comma-separated list.
  – Arguments passed in a method call must be consistent with the number, types and order of the parameters
  • Sometimes called formal parameters
```java
public class MaximumFinder {
    public void determineMaximum() {
        Scanner input = new Scanner(System.in);

        System.out.print("Enter three floating-point values separated by spaces: ");
        double number1 = input.nextDouble();
        double number2 = input.nextDouble();
        double number3 = input.nextDouble();

        double result = maximum(number1, number2, number3);

        System.out.println("Maximum is: "+ result);
    }

    double maximum(double number1, double number2, double number3) {
        return Math.max(Math.max(number1, number2), number3);
    }
}
```
// returns the maximum of its three double parameters
public double maximum(double x, double y, double z)
{
    double maximumValue = x; // assume x is the largest to start

    // determine whether y is greater than maximumValue
    if (y > maximumValue)
        maximumValue = y;

    // determine whether z is greater than maximumValue
    if (z > maximumValue)
        maximumValue = z;

    return maximumValue;
} // end method maximum
} // end class MaximumFinder
```java
public class MaximumFinderTest {
    public static void main( String args[] )
    {
        MaximumFinder maximumFinder = new MaximumFinder();
        maximumFinder.determineMaximum();
    } // end main
} // end class MaximumFinderTest
```

Enter three floating-point values separated by spaces: 9.35 2.74 5.1
Maximum is: 9.35

Enter three floating-point values separated by spaces: 5.8 12.45 8.32
Maximum is: 12.45

Enter three floating-point values separated by spaces: 6.46 4.12 10.54
Maximum is: 10.54
Declaring method parameters of the same type as float x, y instead of float x, float y is a syntax error—a type is required for each parameter in the parameter list.
Software Engineering Observation 6.5

A method that has many parameters may be performing too many tasks. Consider dividing the method into smaller methods that perform the separate tasks. As a guideline, try to fit the method header on one line if possible.
6.4 Declaring Methods with Multiple Parameters (Cont.)

• Reusing method `Math.max`
  - The expression `Math.max(x, Math.max(y, z))` determines the maximum of `y` and `z`, and then determines the maximum of `x` and that value

• String concatenation
  - Using the `+` operator with two Strings concatenates them into a new String
  - Using the `+` operator with a String and a value of another data type concatenates the String with a String representation of the other value
    • When the other value is an object, its `toString` method is called to generate its String representation
Common Programming Error 6.2

It is a syntax error to break a String literal across multiple lines in a program. If a String does not fit on one line, split the String into several smaller Strings and use concatenation to form the desired String.
Confusing the + operator used for string concatenation with the + operator used for addition can lead to strange results. Java evaluates the operands of an operator from left to right. For example, if integer variable \( y \) has the value 5, the expression "\( y + 2 = \) " + \( y + 2 \) results in the string "\( y + 2 = 52 \)", not "\( y + 2 = 7 \)"; because first the value of \( y \) (5) is concatenated with the string "\( y + 2 = \) ", then the value \( 2 \) is concatenated with the new larger string "\( y + 2 = 5 \)". The expression "\( y + 2 = \) " + (\( y + 2 \)) produces the desired result "\( y + 2 = 7 \)".
6.5 Notes on Declaring and Using Methods

• Three ways to call a method:
  – Use a method name by itself to call another method of the same class
  – Use a variable containing a reference to an object, followed by a dot (.) and the method name to call a method of the referenced object
  – Use the class name and a dot (.) to call a static method of a class

• static methods cannot call non-static methods of the same class directly
6.5 Notes on Declaring and Using Methods (Cont.)

• Three ways to return control to the calling statement:
  – If method does not return a result:
    • Program flow reaches the method-ending right brace or
    • Program executes the statement `return`;
  – If method does return a result:
    • Program executes the statement `return expression`;
      – `expression` is first evaluated and then its value is returned to the caller
Declaring a method outside the body of a class declaration or inside the body of another method is a syntax error.
Common Programming Error 6.5

Omitting the return-value-type in a method declaration is a syntax error.
Common Programming Error 6.6

Placing a semicolon after the right parenthesis enclosing the parameter list of a method declaration is a syntax error.
Common Programming Error 6.7

Redeclaring a method parameter as a local variable in the method’s body is a compilation error.
Common Programming Error 6.8

Forgetting to return a value from a method that should return a value is a compilation error. If a return value type other than `void` is specified, the method must contain a `return` statement that returns a value consistent with the method’s return-value-type. Returning a value from a method whose return type has been declared `void` is a compilation error.
6.6 Method Call Stack and Activation Records

• Stacks
  – Last-in, first-out (LIFO) data structures
    • Items are pushed (inserted) onto the top
    • Items are popped (removed) from the top

• Program execution stack
  – Also known as the method call stack
  – Return addresses of calling methods are pushed onto this stack when they call other methods and popped off when control returns to them
6.6 Method Call Stack and Activation Records (Cont.)

– A method’s local variables are stored in a portion of this stack known as the method’s activation record or stack frame
  
  • When the last variable referencing a certain object is popped off this stack, that object is no longer accessible by the program
    
    – Will eventually be deleted from memory during “garbage collection”
  
  • Stack overflow occurs when the stack cannot allocate enough space for a method’s activation record
6.7 Argument Promotion and Casting

• Argument promotion
  – Java will promote a method call argument to match its corresponding method parameter according to the promotion rules
  – Values in an expression are promoted to the “highest” type in the expression (a temporary copy of the value is made)
  – Converting values to lower types results in a compilation error, unless the programmer explicitly forces the conversion to occur
    • Place the desired data type in parentheses before the value
      – example: \( (\text{int})4.5 \)
<table>

</tr>
</tbody>
</table>

Fig. 6.5 | Promotions allowed for primitive types.
Common Programming Error 6.9

Converting a primitive-type value to another primitive type may change the value if the new type is not a valid promotion. For example, converting a floating-point value to an integral value may introduce truncation errors (loss of the fractional part) into the result.
6.8 Java API Packages

• Including the declaration
  \[\text{import java.util.Scanner;}\]
  allows the programmer to use \text{Scanner} instead of \text{java.util.Scanner}

• Java API documentation
  – \text{java.sun.com/javase/6/docs/api/}

• Overview of packages in Java SE 6
  – \text{java.sun.com/javase/6/docs/api/overview-summary.html}
<table>
<thead>
<tr>
<th>Package</th>
<th>Description</th>

Good Programming Practice 6.2

The online Java API documentation is easy to search and provides many details about each class. As you learn a class in this book, you should get in the habit of looking at the class in the online documentation for additional information.
6.9 Case Study: Random-Number Generation

- Random-number generation
  - static method random from class Math
    - Returns doubles in the range $0.0 \leq x < 1.0$
  - class Random from package java.util
    - Can produce pseudorandom boolean, byte, float, double, int, long and Gaussian values
    - Is seeded with the current time of day to generate different sequences of numbers each time the program executes
1 // Fig. 6.7: RandomIntegers.java
2 // Shifted and scaled random integers.
3 import java.util.Random; // program uses class Random
4 public class RandomIntegers
5 {
6    public static void main( String args[] )
7    {
8       Random randomNumbers = new Random(); // random number generator
9       int face; // stores each random integer generated
10
11       // loop 20 times
12       for ( int counter = 1; counter <= 20; counter++ )
13       {
14          // pick random integer from 1 to 6
15          face = 1 + randomNumbers.nextInt(6);
16
17          System.out.printf( "%d  
18          // display generated value
19
20          // if counter is divisible by 5, start a new line of output
21          if ( counter % 5 == 0 )
22             System.out.println();
23       } // end for
24    } // end main
25 // end class RandomIntegers

        int frequency6 = 0; // count of 6s rolled
    }
}
```java
int face; // stores most recently rolled value

// summarize results of 6000 rolls of a die
for ( int roll = 1; roll <= 6000; roll++ )
{
    face = 1 + randomNumbers.nextInt( 6 ); // number from 1 to 6

    // determine roll value 1-6 and increment appropriate counter
    switch ( face )
    {
        case 1:
            ++frequency1; // increment the 1s counter
            break;
        case 2:
            ++frequency2; // increment the 2s counter
            break;
        case 3:
            ++frequency3; // increment the 3s counter
            break;
        case 4:
            ++frequency4; // increment the 4s counter
            break;
        case 5:
            ++frequency5; // increment the 5s counter
            break;
        case 6:
            ++frequency6; // increment the 6s counter
            break; // optional at end of switch
    } // end switch
} // end for
```

Outline

RollDie.java

Iterate 6000 times

Generate a random die roll

switch based on the die roll
49       System.out.println( "Face\tFrequency" ); // output headers
50       System.out.printf( "1\t%d\n2\t%d\n3\t%d\n4\t%d\n5\t%d\n6\t%d\n", 
51             frequency1, frequency2, frequency3, frequency4,
52             frequency5, frequency6 );
53   } // end main
54 } // end class RollDie
6.9.1 Generalized Scaling and Shifting of Random Numbers

• To generate a random number in certain sequence or range
  – Use the expression
    \[ \text{shiftingValue} + \text{differenceBetweenValues} \times \text{randomNumbers.nextInt(scalingFactor)} \]
    where:
    • \text{shiftingValue} is the first number in the desired range of values
    • \text{differenceBetweenValues} represents the difference between consecutive numbers in the sequence
    • \text{scalingFactor} specifies how many numbers are in the range
6.9.2 Random-Number Repeatability for Testing and Debugging

- To get a Random object to generate the same sequence of random numbers every time the program executes, seed it with a certain value
  - When creating the Random object:
    ```java
    Random randomNumbers = new Random( seedValue );
    ```
  - Use the setSeed method:
    ```java
    randomNumbers.setSeed( seedValue );
    ```
  - seedValue should be an argument of type long
Error-Prevention Tip 6.2

While a program is under development, create the Random object with a specific seed value to produce a repeatable sequence of random numbers each time the program executes. If a logic error occurs, fix the error and test the program again with the same seed value—this allows you to reconstruct the same sequence of random numbers that caused the error. Once the logic errors have been removed, create the Random object without using a seed value, causing the Random object to generate a new sequence of random numbers each time the program executes.
import java.util.Random;

public class Craps {

    private Random randomNumbers = new Random();

    private enum Status { CONTINUE, WON, LOST; }

    private final static int SNAKE_EYES = 2;
    private final static int TREY = 3;
    private final static int SEVEN = 7;
    private final static int YO_LEVEN = 11;
    private final static int BOX_CARS = 12;
}
// plays one game of craps
public void play()
{
    int myPoint = 0; // point if no win or loss on first roll
    Status gameStatus; // can contain CONTINUE, WON or LOST

    int sumOfDice = rollDice(); // first roll of the dice

    // determine game status and point based on first roll
    switch (sumOfDice)
    {
        case SEVEN: // win with 7 on first roll
            gameStatus = Status.WON;
            break;
        case YO_LEVEN: // win with 11 on first roll
            gameStatus = Status.WON;
            break;
        case SNAKE_EYES: // lose with 2 on first roll
            gameStatus = Status.LOST;
            break;
        case TREY: // lose with 3 on first roll
            gameStatus = Status.LOST;
            break;
        case BOX_CARS: // lose with 12 on first roll
            gameStatus = Status.LOST;
            break;
        default: // did not win or lose, so remember point
            gameStatus = Status.CONTINUE; // game is not over
            myPoint = sumOfDice; // remember the point
            System.out.printf( "Point is %d\n", myPoint );
            break; // optional at end of switch
    } // end switch
// while game is not complete
while ( gameStatus == Status.CONTINUE ) // not WON or LOST
{
    sumOfDice = rollDice(); // roll dice again

    // determine game status
    if ( sumOfDice == myPoint ) // win by making point
        gameStatus = Status.WON;
    else
        if ( sumOfDice == SEVEN ) // lose by rolling 7 before point
            gameStatus = Status.LOST;
} // end while

// display won or lost message
if ( gameStatus == Status.WON )
    System.out.println( "Player wins" );
else
    System.out.println( "Player loses" );
} // end method play
// roll dice, calculate sum and display results
public int rollDice()
{
    // pick random die values
    int die1 = 1 + randomNumbers.nextInt(6); // first die roll
    int die2 = 1 + randomNumbers.nextInt(6); // second die roll

    int sum = die1 + die2; // sum of die values

    // display results of this roll
    System.out.printf("Player rolled %d + %d = %d\n", die1, die2, sum);

    return sum; // return sum of dice
} // end method rollDice

// end class Craps
```java
public class CrapsTest {
    public static void main(String args[]) {
        Craps game = new Craps();
        game.play(); // play one game of craps
    } // end main
} // end class CrapsTest
```

Player rolled 5 + 6 = 11
Player wins

Player rolled 1 + 2 = 3
Player loses

Player rolled 5 + 4 = 9
Point is 9
Player rolled 2 + 2 = 4
Player rolled 2 + 6 = 8
Player rolled 4 + 2 = 6
Player rolled 3 + 6 = 9
Player wins

Player rolled 2 + 6 = 8
Point is 8
Player rolled 5 + 1 = 6
Player rolled 2 + 1 = 3
Player rolled 1 + 6 = 7
Player loses
6.10 Case Study: A Game of Chance (Introducing Enumerations)

• Enumerations
  – Programmer-declared types consisting of sets of constants
  – `enum` keyword
  – A type name (e.g. `Status`)
  – Enumeration constants (e.g. `WON`, `LOST` and `CONTINUE`)
    • cannot be compared against `ints`
Good Programming Practice 6.3

Use only uppercase letters in the names of constants. This makes the constants stand out in a program and reminds the programmer that enumeration constants are not variables.
Good Programming Practice 6.4

Using enumeration constants (like Status.WON, Status.LOST and Status.CONTINUE) rather than literal integer values (such as 0, 1 and 2) can make programs easier to read and maintain.
6.11 **Scope of Declarations**

- **Basic scope rules**
  - Scope of a parameter declaration is the body of the method in which appears
  - Scope of a local-variable declaration is from the point of declaration to the end of that block
  - Scope of a local-variable declaration in the initialization section of a `for` header is the rest of the `for` header and the body of the `for` statement
  - Scope of a method or field of a class is the entire body of the class
6.11 Scope of Declarations (Cont.)

• Shadowing
  – A field is shadowed (or hidden) if a local variable or parameter has the same name as the field
  • This lasts until the local variable or parameter goes out of scope
Common Programming Error 6.10

A compilation error occurs when a local variable is declared more than once in a method.
Error-Prevention Tip 6.3

Use different names for fields and local variables to help prevent subtle logic errors that occur when a method is called and a local variable of the method shadows a field of the same name in the class.
// Fig. 6.11: Scope.java
// Scope class demonstrates field and local variable scopes.

public class Scope {

    private int x = 1;

    public void begin() {
        int x = 5; // method's local variable x shadows field x

        System.out.printf("local x in method begin is %d\n", x);

        useLocalVariable(); // useLocalVariable has local x
        useField(); // useField uses class Scope's field x
        useLocalVariable(); // useLocalVariable reinitializes local x
        useField(); // class Scope's field x retains its value
    }

}
System.out.printf( "\nlocal x in method begin is %d\n", x );
} // end method begin

// create and initialize local variable x during each call
public void useLocalVariable()
{
    int x = 25; // initialized each time useLocalVariable is called

    System.out.printf( "\nlocal x on entering method useLocalVariable is %d\n", x );
    ++x; // modifies this method's local variable x
    System.out.printf( "local x before exiting method useLocalVariable is %d\n", x );
} // end method useLocalVariable

// modify class Scope's field x during each call
public void useField()
{
    System.out.printf( "\nfield x on entering method useField is %d\n", x );
    x *= 10; // modifies class Scope's field x
    System.out.printf( "field x before exiting method useField is %d\n", x );
} // end method useField
} // end class Scope
// Fig. 6.12: ScopeTest.java
// Application to test class Scope.

public class ScopeTest
{
   // application starting point
   public static void main( String args[] )
   {
      Scope testScope = new Scope();
      testScope.begin();
   } // end main
} // end class ScopeTest
6.12 Method Overloading

• Method overloading
  – Multiple methods with the same name, but different types, number or order of parameters in their parameter lists
  – Compiler decides which method is being called by matching the method call’s argument list to one of the overloaded methods’ parameter lists
    • A method’s name and number, type and order of its parameters form its signature
  – Differences in return type are irrelevant in method overloading
    • Overloaded methods can have different return types
    • Methods with different return types but the same signature cause a compilation error
```java
// Fig. 6.13: MethodOverload.java
// Overloaded method declarations.

public class MethodOverload {
    // test overloaded square methods
    public void testOverloadedMethods() {
        System.out.printf("Square of integer 7 is %d\n", square(7));
        System.out.printf("Square of double 7.5 is %f\n", square(7.5));
    } // end method testOverloadedMethods

    // square method with int argument
    public int square(int intValue) {
        System.out.printf("\nCalled square with int argument: %d\n", intValue);
        return intValue * intValue;
    } // end method square with int argument

    // square method with double argument
    public double square(double doubleValue) {
        System.out.printf("\nCalled square with double argument: %f\n", doubleValue);
        return doubleValue * doubleValue;
    } // end method square with double argument
}
```

Correctly calls the "square of int" method
Correctly calls the "square of double" method
Declaring the "square of int" method
Declaring the "square of double" method
// Fig. 6.14: MethodOverloadTest.java
// Application to test class MethodOverload.

public class MethodOverloadTest
{
    public static void main( String args[] )
    {
        MethodOverload methodOverload = new MethodOverload();
        methodOverload.testOverloadedMethods();
    }
}

Called square with int argument: 7
Square of integer 7 is 49

Called square with double argument: 7.50000
Square of double 7.5 is 56.250000
public class MethodOverloadError {

    public int square(int x) {
        return x * x;
    }

    public double square(int y) {
        return y * y;
    }

} // end class MethodOverloadError

MethodOverloadError.java:15: square(int) is already defined in MethodOverloadError
    public double square(int y) ^
1 error

Compilation error
Common Programming Error 6.11

Declaring overloaded methods with identical parameter lists is a compilation error regardless of whether the return types are different.
6.13 (Optional) GUI and Graphics Case Study: Colors and Filled Shapes

- **Color class of package java.awt**
  - Represented as RGB (red, green and blue) values
    - Each component has a value from 0 to 255
  - 13 predefined static Color objects:
    - Color.Black, Color.BLUE, Color.CYAN, Color.DARK_GRAY, Color.GRAY, Color.GREEN, Color.LIGHT_GRAY, Color.MAGENTA, Color.ORANGE, Color.PINK, Color.RED, Color.WHITE and Color.YELLOW
6.13 (Optional) GUI and Graphics Case Study: Colors and Filled Shapes (Cont.)

• `fillRect` and `fillOval` methods of `Graphics` class
  – Similar to `drawRect` and `drawOval` but draw rectangles and ovals filled with color
    • First two parameters specify upper-left corner coordinates and second two parameters specify width and height

• `setColor` method of `Graphics` class
  – Set the current drawing color (for filling rectangles and ovals drawn by `fillRect` and `fillOval`)
// Fig. 6.16: DrawSmiley.java
// Demonstrates filled shapes.
import java.awt.Color;
import java.awt.Graphics;
import javax.swing.JPanel;

public class DrawSmiley extends JPanel {
    public void paintComponent(Graphics g) {
        super.paintComponent(g);

        // draw the face
        g.setColor(Color.YELLOW);
        g.fillOval(10, 10, 200, 200);

        // draw the eyes
        g.setColor(Color.BLACK);
        g.fillOval(55, 65, 30, 30);
        g.fillOval(135, 65, 30, 30);

        // draw the mouth
        g.fillOval(50, 110, 120, 60);

        // "touch up" the mouth into a smile
        g.setColor(Color.YELLOW);
        g.fillRect(50, 110, 120, 30);
        g.fillOval(50, 120, 120, 40);
    }
}

// Fig. 6.17: DrawSmileyTest.java
// Test application that displays a smiley face.
import javax.swing.JFrame;

public class DrawSmileyTest
{
    public static void main( String args[] )
    {
        DrawSmiley panel = new DrawSmiley();
        JFrame application = new JFrame();
        application.setDefaultCloseOperation( JFrame.EXIT_ON_CLOSE );
        application.add( panel );
        application.setSize( 230, 250 );
        application.setVisible( true );
    } // end main
} // end class DrawSmileyTest

Fig. 6.19 | Randomly generated shapes.
6.14 (Optional) Identifying Class Operations

• Identifying operations
  – Examine key verbs and verb phrases in the requirements document

• Modeling operations in UML
  – Each operation is given an operation name, a parameter list and a return type:
    • \( \text{operationName}( \text{parameter1}, \text{parameter2}, \ldots, \text{parameterN} ) : \text{return type} \)
    • Each parameter has a parameter name and a parameter type
      – \( \text{parameterName} : \text{parameterType} \)
6.14 (Optional) Identifying Class Operations (Cont.)

– Some operations may not have return types yet
  • Remaining return types will be added as design and implementation proceed

• Identifying and modeling operation parameters
  – Examine what data the operation requires to perform its assigned task
  – Additional parameters may be added later on
